Website Accessibility Audit Sample

Suyog Dhungel
DHS Certified Trusted Tester

An anonymized excerpt adapted from a completed website audit. This sample shows how observed barriers are explained to developers and content teams. It is a portfolio excerpt, not a current assessment of the original website.

Evaluation approach

The source audit combined manual keyboard navigation, NVDA screen-reader testing, WAVE, axe DevTools and inspection of page structure and interactive components. The target standard was WCAG 2.2 Level AA.

Scope represented in this excerpt

Shared navigation, desktop and mobile controls, image alternatives and access to location information. The original audit covered additional templates, content types and components.

What the client receives

• A defined scope and recorded testing methods.

• Findings with affected components, user impact and relevant WCAG criteria.

• Practical remediation guidance and priorities.

• A retesting plan for changes made by the implementation team.

Credential

DHS Trusted Tester Certification - Trusted Tester for Web on Windows
U.S. Department of Homeland Security
Issued 7 October 2026 | Certification ID TT-2710-09754

Client names, URLs, branding and identifying content have been removed. Findings are paraphrased from the source report; remediation outcomes are not claimed.

Finding 1 Primary navigation

Source finding CW-02 | Source priority Critical

Affected area

Shared header, desktop dropdown menus and mobile menu control.

Observed barrier

Mouse users could reveal submenu destinations, but keyboard and NVDA users did not have an equivalent reliable way to open and traverse them. Parent items used placeholder links without clear expanded or collapsed state. The mobile opener used a clickable span instead of a semantic button.

User impact

Visitors relying on a keyboard or screen reader could miss destinations in the primary navigation and struggle to reach important content.

Relevant requirements

WCAG 2.1.1 Keyboard (Level A) and 4.1.2 Name, Role, Value (Level A). These requirements address keyboard operation and programmatic control information respectively.

Recommended correction

Use native buttons for controls whose purpose is to expand navigation. Expose the expanded state and relationship to the submenu. Support keyboard opening, traversal and closing with predictable focus. Replace the mobile span with a named button and correct the shared template so the change applies across pages.

Retesting acceptance checks

With a keyboard, reach the opener, open the submenu, access its destinations, close it and continue in a logical sequence. With NVDA, confirm the control has a meaningful name and accurate state. Repeat on desktop and mobile layouts in the agreed test environment.

Finding 2 Map information

Source finding CW-07 | Source priority High

Affected area

A homepage map communicating working locations.

Observed barrier

The map communicated geographic locations visually but used empty alternative text. An equivalent set of locations was not available to screen-reader users.

User impact

A visitor using NVDA could not obtain the location information that sighted visitors received from the map.

Relevant requirement

WCAG 1.1.1 Non-text Content (Level A): meaningful non-text information needs an equivalent text alternative.

Recommended correction

Keep the visual map, provide a concise identifying text alternative and publish the full location information as structured HTML beside or below it. Avoid placing all detail in a very long alt attribute. If locations are interactive, test the controls for keyboard access and meaningful names.

Retesting acceptance checks

Use screen-reader navigation to find the map description and the complete location list. Compare the textual information with the visible map. If the map is interactive, verify keyboard operation and control names.

How I support delivery

Agree representative pages and complete user journeys, document barriers, discuss priorities with the team, and retest implemented fixes within the agreed scope.
